The approach using Conversational Artificial Intelligence (CAI) and artificial general intelligence (AGI) has focused on snake classification with snake description using Open AI's API is a good approach. The authors should also concentrate on

1. The article is too general, more elaboration on the work
2. Article lacks literature survey, need extensive literature survey
3. Type of image needed needed to classify is uncertain. what is the dimension of the image.
4. Scalability challenges may arise in handling larger datasets

In conclusion, the approach is new and have many advantages, while keep the article short with limited general information, stress more on the technical aspects. Try to find more related articles which justifies your study. Depending on pretrained models some times becomes more dependent.
