When reading the article in question, I notice that there is a significant lack of statistical analysis. The absence of this data may compromise the credibility and validity of the conclusions presented.

Statistical analysis plays a crucial role in scientific research, as it allows you to identify patterns, trends and relationships between variables. By not including this analysis, the author fails to provide quantitative evidence to support his claims, making them merely based on subjective observations.

Furthermore, statistical analysis is essential to evaluate the statistical significance of the results obtained. Without this analysis, it is not possible to determine whether the findings are truly statistically significant or whether they can be attributed to chance.

Lack of statistical analysis can also lead to misinterpretations of data. Without proper statistical testing, it is not possible to say with confidence whether an observed relationship is causal or just a coincidence. This can lead to misleading conclusions and an inadequate understanding of the phenomenon studied.

It is recommended that the author revises his article and includes an appropriate statistical analysis. This will strengthen your research by providing objective and reliable evidence to support your conclusions. Furthermore, statistical analysis will allow readers to evaluate the robustness of the results and to make more accurate inferences from the study.

In summary, the absence of statistical analysis in the article in question is a significant limitation that compromises the validity and reliability of the results presented. It is essential that the author includes adequate statistical analysis to strengthen his research and provide objective evidence to support his conclusions.

When analyzing the article in question, I noticed an error in the numbering of the tables mentioned in the text. This inconsistency compromises the reader's clarity and understanding, making it difficult to correlate the information presented in the text and the corresponding tables.

Correct numbering of tables is essential to facilitate reference and search for specific information. By citing tables with incorrect numbers, the author creates confusion and can lead the reader to misinterpret the data presented.

Furthermore, the lack of correspondence between the numbering mentioned in the text and the actual numbering of the tables may affect the credibility of the article. Readers may question the accuracy and reliability of the information

presented, as numbering errors may suggest a lack of care and attention in preparing the work.

It is recommended that the author review the article and correct the numbering of the tables mentioned in the text. This will ensure the consistency and accuracy of the information presented, making it easier for readers to understand and correctly interpret the data.

In summary, the error in the numbering of the tables cited in the text is a flaw that compromises the clarity and understanding of the article. It is essential that the author corrects this inconsistency to ensure the accuracy and reliability of the information presented, as well as to avoid confusion and misinterpretations on the part of readers.

Suggestion to add demographic data of the studied population as well as characteristics of the location (city where the study was carried out) in order to have a better understanding of the results presented in the article.
