The article The Future of Education and Human Development in The Era of Generative Pre-Trained Transformer (GPT) Models provides a survey of existing literature for both the aspects(Positive and negative) of Generative AI or the LLMs present in the market for free. Although the article talks about a significant issue present for the education society, it lacks in providing any additional thoughts or dimensions in which previous researchers have not worked. If this article is meant to be only a review of existing techniques then I can say it stands valid. My recommendation for the author to make the article more suitable for use are as follows:

1. Try to make a comparative analysis of available GPT models in the market based on some parameters like their limitations, their ease of use, their ethical aspects.
2. List some major areas of education or human development where Generative AI can be of great use in future or should be restricted at all.
3. For pros and cons if you can show the examples from few most popular GPT models as a kind of comparison then it would be great.
