Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Lethal intrauterine growth restriction-cortical malformation-congenital contractures syndrome. ORPHA:2570*

Holoprosencephaly-hypokinesia syndrome is an extremely rare and fatal central nervous system malformation occurring during embryogenesis, presenting prenatally with holoprosencephaly and fetal hypokinesia as major features. Other manifestations include microcephaly, multiple contractures and intrauterine growth restriction. There have been no further descriptions in the literature since 1988.
