

# Review of: "The Disruption of the COVID-19 Pandemic on Farm Produce and its Implications for the Future of Food Security - A review"

Maria S. Tapia

Potential competing interests: No potential competing interests to declare.

This is a major effort made by the authors. However, in this period of the year, with 2022 ending, it seems extemporaneous, since it is a topic that was highly discussed from various angles in the midst of a pandemic, full lockdowns and panic, when dramatic disruptions of the supply chains occurred and food systems were greatly affected. Then, no short-term exits were in sight, even less, vaccination. Many forecast estimates are mentioned during the pandemic for year 2021, therefore, it should be contrasted with what actually happened in 2021 and what has happened in light of the 2022 data that have already been published. In this way, recommendations can be given for future scenarios with other pandemics. The COVID-19 pandemic has not ended yet, but the situation has changed completely with respect to 2020. For future scenarios, it is essential to raise awareness about highly relevant aspects such as zoonoses. All references are from the years 2020 and 2021. With the COVID-19 pandemic, publications have been generated at breakneck speed, so some from 2020 could be considered not actualized or valid. It would be great if authors include recent data.
