Potential competing interests: No potential competing interests to declare.

The article doesn't meet the standard of a scientific journal article, but fits more into the technical report of planting aquaponic melons in the greenhouses. The methods should be written more clearly and systematically, which will then open them to be repeated/replicated by other researchers. Therefore, it should be concise, clear, and easy to follow.

The use of English must cover all parts of the manuscript; otherwise, it might be uncommunicative to its readers. The quantitative analysis should also follow the standard statistical procedures by showing how the result was achieved.

All in all, it needs to be revised heavily to make it fulfill the basic requirements of a scientific journal article. Read and compare it with other writings, either on the same subject or on different ones.
