Potential competing interests: No potential competing interests to declare.

The issue of climate change has been the subject of so many political, social, and media debates that it is sometimes difficult to discern between so many voices and the facts that have been proven by science, which has approached the problem with a multidisciplinary vision.

Given the complexity and multifaceted nature of climate change or global warming, it is of utmost importance that the media play a responsible role in disseminating scientific information. Their accurate reporting can significantly influence public opinion and contribute to informed decision-making.

It is exciting to analyze the arguments put forward by the deniers. In this sense, I find the work very interesting and timely.

The article's analysis of the arguments made by denialists to reject the scientific evidence is particularly timely. The main conclusion is denialists attack the scientific evidence but provide no other evidence to support it.

Regardless of the arguments for or against, this work is very interesting and timely. It contributes to a crucial debate on climate change and the dissemination of the results.

I recommend its publication.
