## 3' Untranslated Region SNP

National Cancer Institute

## Source

National Cancer Institute. <u>3' Untranslated Region SNP</u>. NCI Thesaurus. Code C45394.

A 3' Untranslated Region SNP consists of a variation at an appreciable frequency between individuals of a single interbreeding population of a single nucleotide, due to base substitution, at an equivalent location within the sequence region at the 3' end of a messenger RNA (following the stop codon) that is not translated into protein and may contain transcription and translation regulating sequences.
