Potential competing interests: The author(s) declared that no potential competing interests exist.

The article is a valuable work on Economies study but location is a multidisplinary work that need many expert of urban planning (for calculate current schools service area and site selection) and demography (for population forecast base on different scenario of population growth).

Today's use of GIS analysis same as network analysis, business analysis in location helps in explore current service area and areas with limitation.

The title of article is an ambiguity, it has done in the city of Mexico but title is "Improving the accessibility to public schools in urban areas of developing countries". It's better note on case study in title.

Finally although the article is very good and useful for economic scientist but it's not a practical text for planner and decision makers.

Regards
