**Potential competing interests:** No potential competing interests to declare.

I appreciate the authors for making an attempt in the realization of a nano gate supercapacitor with faster discharge and safe operation. However, the manuscript felt more like a discussion report than a research article. A deeper discussion into the theoretical realization of the so-called nano gate capacitor device is always advisable. Moreover, it is suggested that a clear distinction between EDLC and the nano gate capacitor should be given with the help of schematics for better understanding.
