

Review of: "The Role of Plant Growth-Promoting Bacteria (PGPB) in Soil Fertility Restoration in Chemical-Contaminated Areas"

Balaram Mohapatra

Potential competing interests: No potential competing interests to declare.

The article is relevant for the readers. But I have some concerns, listed below:

1. The authors must be very specific about the role of PGPB, as many of the facts on PGPB are extensively known and studied.
2. Authors should portray some new insights (of their own) on use of PGPB in agriculture.
3. It will be more interesting if authors can highlight on nutrient acquisition mechanisms like Zn, K, and Mn solubilization of PGPB, which are not known in detail, till date.
4. Authors can be more precise on risk assessment part (ARB).
