The presented research article titled "Glucolipotoxicity: A Novel Different Perspective on the Causes of Cancer" summarizes the mechanisms underlying the Warburg effect and glucolipotoxicity, highlighting their implications for tumor growth. The article is in well-written language but lacks in-depth discussion and analysis. I have the following comments on the current manuscript:

1. Add line numbers across your manuscript.
2. Add figures to illustrate the mechanism of glucolipotoxicity.
3. Add a comprehensive reference list on glucolipotoxicity in the tumor microenvironment, especially focusing on the most recent publications.
4. Develop some strategies targeting cancer treatment based on your hypothesis and previous research on glucolipotoxicity.
5. Add information on the clinical trials involving glucolipotoxicity in cancer treatment.
