The article is informative and precise. Although correct, the methodology for obtaining information should better explain the article selection criteria and whether the publication time was taken into account.

The map presented shows hydrological systems that the article does not refer to; it is better to describe in a table what was found in the different hydrographic basins, the studies found, and the information necessary to complete the information of each one, providing researchers with a better guide to begin specific studies in each of the hydrographic systems. It is also appropriate to explain why articles in languages other than English were discarded. This selection could have omitted specific information contributing to the study. A superficial review of this article to determine its relevance would have been recommended. It is an interesting article with a collection of deep information.
