Potential competing interests: No potential competing interests to declare.

This paper presents the relationship between dredging and fisheries or shoreline evolution. It has some guiding significance in practical engineering.

Major reviews:

In terms of the Introduction, it is a popularization of science. It lacks a review of previous results from different researchers, and the research gap that this paper can contribute to is not pointed out. Further, when it comes to the Discussions, it lacks deep analyzation. The logical structure is missing, such as the titles in sections 5 and 6.

Minor reviews:

The Figures are not cited and marked in the text. The authors should add something like 'as shown in Figure or Table ××'; Section 2.1.2: 'thermo-mediterranean' instead of 'thermomediterranean'; Figure 5: the colors used in the figure and legend seem to be different; Figure 6 is missing, and 'Engraissement' in Figure 6&8 should be 'accretion'? Please check the titles of Sections 6 and 6.1.
