

Review of: "[Review Article] Melatonin, ATP, and Cataracts: The Two Faces of Crystallin Phase Separation"

Tao Liu

Potential competing interests: No potential competing interests to declare.

The authors conducted a very interesting review of melatonin, ATP, and cataracts. There are some remarkable points that the authors should take into account.

1. The advantages and disadvantages of the research method introduced by the authors should be discussed, such as in Part 2 (2. Molecular Crowding Induces Aggregation of Crystallins via Phase Separation) of the article.
2. The article should cite some of the latest research papers for comparative analysis, such as research papers from 2023 and 2024.
