Dear Gabriele Marinello.

I send you a review of the paper titled "Dynamics of Three-Level Laser Pumped by Electron Bombardment" for publication in Qeios.

In this paper, the authors have studied some nonclassical properties such as photon statistics and squeezing of the state of the cavity light generated by a three-level laser. The calculation results appear to be correct. However, i think some things like below need to be clarified:

- 1) It is necessary to point out (add a few sentences in the conclusions) some points that are superior to Fresseha's products in reference [10], especially in terms of practical application. This will enhance the article's contribution to science.
- 2) Add some recent references to increase the topicality of the article. Agree on how to cite articles.
