Eicosanoid Modulation

National Cancer Institute

Source

National Cancer Institute. *Eicosanoid Modulation*. NCI Thesaurus. Code C40647.

Eicosanoid Modulation involves a change in the quality of the existing state of activity of hormone-like endogenous unsaturated and oxygenated fatty acid derivatives of arachidonic acid (eicosanoids) that act near the site of synthesis and have a specific regulatory effect on the activity of target cells in host defense reactions, immediate hypersensitivity, and inflammation. Eicosanoids include prostaglandins, leukotrienes, thromboxanes, and hydroxyeicosatetraenoic acid compounds.
