Potential competing interests: No potential competing interests to declare.

This paper is about a study proposal to conduct a scoping review using academic and grey literature to answer questions about the concept of toxic positivity. The overall research concept is novel. However, before pursuing this research, it is important to pay attention to the matter of using grey literature in scoping reviews, as the goal of a scoping review should be the generation of quality evidence, and this requires relying on/referring to scientific/academic literature that contains quality evidence. Further, searching for and systemizing grey literature is a complex process. The presented literature review can be further advanced to explain whether any prominent scholars have attempted to measure or develop a scale for toxic positivity—all the best to the researchers in their research endeavor.
