Reviewer report second round

This paper aims to assess the parental attitude, knowledge, and practice regarding valid vaccination schedules and identify the reason for providing invalid vaccine doses.

All other concerns from my previous comments were addressed. However still has some concern:

Table 1: The column of fathers is still confusing; meanwhile the target population were mothers.

Table 2. The issue of condition of child's vaccine card and vaccination card available

- The first one card given and available or not.
- The second one card available yes or no

This information is the same, unless you remove the availability on the first one.

Table 3. Look at the narratives, somewhere it is said the responded did not know of providing OPV with 95,39%, and about 55% had knowledge of timing of 2nd measles dose.

This table is not clear whether is reporting the positives or negatives.

Data Analysis Technique

The analysis of quantitative data improved though it is lacking on how is the KAP analyzed?

Overall improved
