Potential competing interests: No potential competing interests to declare.

This article attempts to discuss very complex issues such as sustainability and climate change based on a very basic and limited methodological approach. Consequently, the article merely speaks to 'what' but fails to address 'why' and 'how'.

Sustainable development, based on the Brundtland Commission (1987), begin with development (meeting basic needs, etc.). A world, country, or community in which poverty is endemic will be unable to achieve sustainability. The two countries have different baselines, different ideologies, different social and economic challenges; therefore, it is important to justify why they were selected for the comparison. To my mind, the article presents a superficial discussion of the real issues.
