Review of: "Efficient Management of Information Communication Technology Resources in an Organisation"

Leonardo Hernán Talero Sarmiento[1]

1 Universidad Autónoma de Bucaramanga

Thank you for the opportunity to review this article. I have a few notes that could enhance readability:

Introduction:

1. Establishing Context: Start with a brief overview of the current state of ICT resource management in organizations, highlighting its evolving role and importance. This sets the stage for your study's relevance.
2. Identifying the Gap: While you've outlined what your study will cover, the specific gap in the existing literature or practice your study addresses is not immediately clear. Clarify the unique aspect or perspective your study brings to the field.
3. Literature Review: You've cited several sources, which is commendable. Ensure that these references are directly relevant to your research question and that they collectively build a narrative leading to your study's necessity.
4. Purpose and Objectives: You've clearly stated the purpose and objectives of your study. Consider making them more specific, detailing the unique insights or contributions your study aims to provide within the field of ICT resource management.
5. Significance and Contributions: Articulate more explicitly the expected contributions of your study. How will it advance understanding or practice in ICT resource management? What are the potential implications for practitioners or policy?
6. Clarity and Conciseness: Some parts of your introduction could be more concise. Aim to eliminate redundant sentences or phrases to make the introduction more streamlined and impactful.
7. Engaging Writing Style: Your writing is clear but could be more engaging. Try to weave in a narrative or pose intriguing questions to capture the reader's interest.
8. Alignment with Journal's Scope: Ensure that the focus and content of your introduction align with the scope and audience of the journal to which you are submitting.
9. Definition of Terms: The definition of "ICT resources" is well-placed. Consider if other key terms need similar clarification for your intended audience.

Literature Review:

The Literature Review section works more like definitions instead of presenting the evolution of a topic. This section is essential to locate the research in the academic context. You can start by talking about the definition of the topic, add information regarding components, and how those components have evolved over time. Finish by indicating the novelty or

research gap. In this sense, you can join this section with Related Works, which requires an introductory statement to preface the synthesis of selected studies. Moreover, there needs to be a clear articulation of how these studies correlate with the article's objectives.

Methodology and Results:

In the methodology section, please add information on database sources and the queries explicitly. Noting the components of the query will be an extra step; also, try to use as many synonyms and equivalences as possible and applicable. The absence of a distinct "Results" section leaves a gap that precludes a seamless transition into the discussion. I suggest delineating the practical and theoretical implications to align with the literature review.

Finally, keep working on your paper; I hope to see the next version.

Best regards.
