# Pulmonary blastoma

INSERM

## Source

*INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Pulmonary blastoma. ORPHA:64741*

Pulmonary blastoma (PB) is a biphasic primary lung neoplasm, belonging to the group of sarcomatoid lung carcinomas (SLCs; see this term). The tumor contains both an epithelial well-differentiated component, showing tubular architecture resembling the normal fetal lung, and a mesenchymal undifferentiated stroma with a so-called "blastema-like" configuration that resembles an embryonic lung.
