# Endobronchial Lipoma

National Cancer Institute

## Source

National Cancer Institute. *Endobronchial Lipoma*. NCI Thesaurus. Code C5063.

A rare benign adipose tissue neoplasm located within the lumen of a bronchus. It is predominantly found in males and usually originates within the fatty tissue between bronchial cartilage. May cause irreversible pulmonary damage distally. Two-thirds of the tumors occur on the right side and most are located on the first three subdivisions of the tracheobronchial tree.
