Farber Lipogranulomatosis

National Cancer Institute

Source

National Cancer Institute. *Farber Lipogranulomatosis*. NCI Thesaurus. Code C84710.

A very rare autosomal recessive metabolic disorder affecting lipid metabolism. It is caused by mutations in the *ASAH1* gene and is characterized by fatty accumulation in the body tissues. Patients develop lipogranulomas in the skin and internal organs, edema and pain in the joints and a hoarse voice. It may be associated with intellectual disability.
