The provided original research paper was well written and an excellent idea to learn about the medical professional who are suffering from various disease during COVID-19 era. Though the research was presented systematically but required some correction in the following area according to my point of view such as

1. The title of the research must be changed.
2. Major correction must be made in the methods section such as how can we measure relative risk in case of cross sectional descriptive study? In addition, must explain the data collection methods in details. Moreover, it is necessary to use any standard scale to measure the disease status level among the clinical & para clinical department of the medical students.
3. Result section required explanation of each data presentation either using 4/5 graphical and tabulation or combination of both in a systematic way. Furthermore, to make the result section logical, it is necessary to introduce the investigation report regarding to mention the health status of the medical students & their association of the both episodes of the symptoms of COVID 19 era.
4. Conclusion section required major correction regarding brief systematic explanation
5. References section required following any style either Vancouver or Harvard etc
