Potential competing interests: No potential competing interests to declare.

The manuscript focuses on the evaluation of the effect of two probiotic bacteria on the viability of *Staphylococcus aureus* when applied in serum and gelatin on chicken.

I suggest that the study objective be clearly defined. This is to avoid questions related to the viability of probiotic bacteria.

In the methodology, I suggest specifying the culture medium used for counting *Staphylococcus aureus*.

In the legend of Figure 1, there is a typographical error: "why" instead of "whey."

I think Figure 1 repeats the data from Table 1. Also, the error bars are very significant. Can you clarify the difference and justify the use of Figure 1, please?

I suggest that in the discussion, you deepen the concepts related to the bioactive compounds responsible for the observed effects.

The reference list should be reviewed to ensure uniformity of style.

English can be improved.

The manuscript may be accepted for publication after major revision.
