Potential competing interests: No potential competing interests to declare.

The objective of the research is good, and the research itself is interesting; however, the discussion of the methodology and the procedures made to solve the Unaccounted for Water (UFW) problem may still be improved. For the abstract, you should just focus on the problem, the proposed solution, and its results.

You may include an overall illustration of the framework so that readers will be guided through the listed steps you have provided. The number of teams deployed, the composition of each team, and how often they are deployed to conduct the field survey.

Also, including the water received and lost due to leaks per "grid" would be a good addition in the future.
