Dear Authors;

The debated topic is really interesting, and the present research has novelty for readers. For a better status of this paper, I recommend some points to be revised. The detected issues are presented below:

- The results must be quantified in the abstract.
- The new references must be added to the paper. The number of references must be updated until 2024. The current status of the background is not well-written and complete.
- The history of this paper must be presented with the brief key results.
- The sensitivity analysis of the selected variables must be checked.
- Research hypotheses must be presented and validated.
- The validity of the methodology must be investigated (a Validation section must be added).
- The discussion of results is not suitable for readers. The numerical results must be presented in figures for better comparison.
- Key results with values (numerical values) must be inserted in the conclusion section.
- The recommendation and limitation sections must be added to the manuscript for future related papers.
