# Non-syndromic male infertility due to sperm motility disorder

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Non-syndromic male infertility due to sperm motility disorder. ORPHA:276234*

Non-syndromic male infertility due to sperm motility disorder is a rare, genetic, non-syndromic male infertility disorder characterized by infertility due to sperm with defects in their cilia/flagella structure, leading to absent motility or reduced forward motility in fresh ejaculate. Reduced semen volume, oligospermia and an increased number of abnormally structured spermatozoa is often present.
