Potential competing interests: No potential competing interests to declare.

This article introduces a case study of Kolkata's built fabric which has a dynamic morphological influence, catering to crime prevention through elevated platforms called 'Dalan'. The increasing demand for apartment buildings has led to a loss of city identity and natural security systems. The research paper aims to address this issue by providing implementable environmental design measures, focusing on ward-level requirements across Kolkata Metropolitan Area (KMA), and potentially implementing in other urban areas.

However, there are some concerns that should be addressed as follows:

1. The literature survey is not thorough. It is suggested to review similar studies to compare your findings and highlight the researches questions.

2. The aim of the research and the results should be discussed more extensively.
