Potential competing interests: No potential competing interests to declare.

This paper delves into the significance of increasing returns to scale in the realm of economic discussions since the 1930s. This topic holds particular complexity, as it poses a challenge to theories rooted in both partial and general equilibrium, following the traditions of Marshall and Walras. While this discourse is not novel per se (indeed, the importance of increasing returns to scale is broached by Adam Smith in the opening chapter of his seminal work, 'On the Division of Labor'), I find this paper to be of great relevance to scholars. As a suggestion, the author might consider condensing the content to enhance readability. My heartfelt congratulations and best regards to the author.
