Potential competing interests: No potential competing interests to declare.

1. Over the period, is there any reduction in combustion/system efficiency so that the quantity of emissions may vary?
2. What are the methods/strategies used to reduce the emissions?
3. Why are PCDD/Fs emissions alone considered in this study? What about other emissions?
4. What instruments are used to measure these emissions?
5. Try to find the sources of material in the MSW that, when burned, emits/converts into harmful emissions, so that these elements can be separated from the municipal waste.
6. What is your conclusion, or what suggestions do you have from your studies?
