The manuscript deals with an interesting research study, it is well organized and systematically addressing the survey results. In this respect the following review comments can be considered, in order authors to improve their study and to reach it a novel publishable status, accordingly.

- 1.The full name of the SEI acronym can be written in the first time insertion of this term in the study, in the Abstract section.
- 2.The exact calendar year and the country in which the sampling took place, have to be added in the Abstract section.
- 3.At the end of Abstract section authors denoted the consideration of the future financial security on behalf of the social entrepreneurship. In this context authors can enrich their findings by denoting the priority issues (or indicative constraints and drivers) that have been derived from the communities/consumers side.
- 4.Based on authors statement that: "we propose the research model (figure1) and the following hypotheses", all tested hypotheses can be denoted in the form of sentences per hypothesis: H0....., H1....., and H2.....
- 5.The average age of respondents, 21 years old, implies that the sampling procedure was mainly focused only on young entrepreneurship, excluding aged and more business-mature professionals from the study.
- 6.A short introduction of the terminology and functionality of the "Hockerts model testing" can be added, thus, better explaining the selection of this model to fit to the specific variables of the analysis, comparing to other models available. This new information can be presented in the form of separate subheading/subsection.
- 7.At the Discussion section a narrative evaluation and synthesis of each one of the hypotheses' tested can be provided in response to the research objectives of entrepreneurship in alignment with: financial security, social entrepreneurship scholars and practitioners, perceived financial stability and SEI specifications.
- 8.Considering the "development of social entrepreneurship and its positive effects on society by resolving financial issues and establishing conducive settings", authors are recommended to revisit and to succinctly signify those social and economic incentives offered to support such a development, not only in the Bangladeshi context, but also to other geographical contexts worldwide.
