The submission by Victor N. Almeida entitled ‘Somatostatin and the pathophysiology of Alzheimer’s disease’ explained the importance of altered neuropeptide somatostatin levels and somatostatin-positive interneurons (SST-INs) in the pathophysiology of Alzheimer’s disease (AD).

In general, the manuscript presented is interesting. My suggestions for the author are listed below.

1. Abbreviations in the manuscript should be checked.
2. References in the article should be checked from the reference list.
3. The number of current references in the article should be increased (2023)
4. ‘We’ should be corrected in the last paragraph of the introduction.

The manuscript is structured as follows. In section 2, we will cover the SST models of AD. In section 3, I will propose a novel model based on SST-IN hyperactivity and hypofunction.
