

Review of: "Factors influencing women's decision choosing a public or private health facility for tuberculosis (TB) services: An analysis of Nepal demographic and health survey data 2016"

Habtamu Hasen

Potential competing interests: No potential competing interests to declare.

General Comments: Thank you for coming for public- private mix management of TB concept. Any study on private -public mix health seeking behaviour in LMIC countries is important as efforts are made to control/eliminate TB globally from the perspective of Private health system. The manuscript has paramount but needs modification to make it publishable. Your articles need extensive grammar editing and coherence of ideas. Re synthesized the introduction part

Better to consistent with your title through out your documents

Do not repeat words, see your measurements and dependent variable

Better to change descriptive analysis to sociolect-demographic characteristics and change bivaraite to bi variable logistic regression and multivariate to multivariable regression. And also rather than putting as bi variate and multivariate you can say factors associated with.

I am a little bit confusing on your outcome variable (private user and public user), better to reanalyzed as data.

Be diplomatic while writing scientific papers do not say "Muslim culture is rigid regarding women interacting with male service providers"
