The idea of the work seems important. A number of experiments have been done in this work with significant results. However, some refinements should be made to the work as follows:

- The title needs to be revised. Remove the word "some" from the title.
- Overall, the English writing should be revised. All the work done should be reported in past tense.
- The writers should be consistent in using different units.
- Both solvents used for extraction are polar. It could have been better to use some non-polar solvent in the study.
- A number of biochemical assays have been performed, which is a good thing; however, they were not properly analysed or statistically described.
- Some tables are too simple to keep; they may be removed, and data may be directly mentioned in the text.
