Here is the review of the paper "A Methods Note on Remote Sensing Platforms and Large-Scale Archeological Impact Assessments (AIA) in the Philippines." Overall, I have some concerns.

It does not meet the standards of a scientific paper and reads more like a manual. Although the topic is interesting, the finishing is lacking. I suggest rejecting the paper and advising the authors to rework it into an illustrative example using real projects.

It might be beneficial to transform the paper into a practical guide, a monograph, providing step-by-step instructions and tool recommendations for new users.

Additionally, the author should provide more explanations and avoid generalizations without proper references in geospatial analysis and predictive modeling.

Here are a few steps I would like to recommend to authors:

- The structure of the paper must be revised
- Background research poorly presented
- References, references, and again, references
- I am not too fond of the figures and, again – references
- Discussion must be rewritten properly
- Is there a Conclusion?

I wish all the best to the author, and I hope he can correct the paper's lack.
