"Reprogramming of GLP-1 Response at Prediabetes for the Prevention of Type 2 Diabetes: The Role of Albumin and GLP-1 Receptor Agonists" is very well-written. A few suggestions:

Reference for :Projections for 2045 indicate an alarming increase to 8.3%, equivalent to 587 million individuals."

This statement needs verification because in my opinion common belief is that pre-diabetes is exclusive to T2DM and not T1DM- "Contrary to common belief, prediabetes is not exclusive to type 1 diabetes but is a chronic and reversible metabolic disorder."

An explanation regarding gender difference will be helpful- "The GLP-1 response to oral glucose is impaired by up to 25% in individuals with prediabetes and type 2 diabetes, particularly in women."
