Potential competing interests: No potential competing interests to declare.

The paper evaluates the Diabetes Risk Score Tool for Detecting Undiagnosed Type 2 Diabetes Mellitus among undiagnosed individuals.

- Research is well justified in the introduction section, but the main scientific contribution is missing.
- In the methodology, inclusion and exclusion criteria should be justified.
- Results section started with additional data description rather than results.
- The only figure in the paper is not representing what is written about (ROC or AUC) or the relation between specificity and sensitivity??
- Paper needs careful revision to be accepted for publishing, including the following points:
- 1- The language needs careful revision.
- 2- Tables need extra clarification.
- Results need evidence of superiority as it is not clear from the paper.
