Potential competing interests: No potential competing interests to declare.

The title of this study should emphasize the study design. Therefore, the writer should tell the readers about this qualitative study from the beginning. Despite the analysis being conducted by software, this study was not aimed at analyzing the relationship between a cause and an effect.

From the abstract section, the writer should write respondents' characteristics to explain for what purposes the respondents were chosen. However, the abstract is thorough. The readers can see the problems that arose from the qualitative study.

The biases in the method and result sections are not significant due to the nature of the study design as a descriptive study. The result is not generalizable and can only be applied in the area of the study.
