Potential competing interests: No potential competing interests to declare.

The manuscript is well laid out and the language is simple and clear to convey the thoughts of the authors.

I want to suggest that the authors reworked the tables and graphs in a standard journal format so as not make it look like a writeup except if this format is agreeable to the editor.

The paper gave further evidence that the methodology of using herbs in disease situation among Africans should be more standardized even though, the plant materials used in this research does not pose health risk to the test animals. Dosage is key in the administration of drugs when it comes to humans and I found out that in many rural setting in African, this is still not being practiced.

I suggested a minor review and the paper be accepted for publication.
