The manuscript examined an interesting topic: the energy transition in Sweden and India. Though an interesting topic, the paper need to address the following issues: 1) The abstract seems too long. Better if summarised to 200 words. 2) Why did they choose to compare Sweden and India? The disparity between the two countries are too wide. Sweden is an advanced economy but India is not. I suggest a comparison between to developing countries or between two developed countries. Also, the authors can proceed with their choice but should provide a better justification for the choice.

Furthermore, the article is weak scientifically especially in the methodology and in not following the IMRaD approach. The introduction can be strengthened with relevant and current literature. Then, the materials and methods used can now be explained, how the data were obtained, whether qualitative or quantitative approach is involved or not. If these are done, the result section will naturally flow and the discussion will be interesting to wider audience.
