

Review of: "Exchange Rate Pass-Through and Inflation on Unemployment in Nigeria"

Hebatalla Atef Emam¹

¹ Cairo University

Potential competing interests: No potential competing interests to declare.

- There is a need to add the theoretical foundation of exchange rate pass-through to inflation and how changes in the exchange rate are transmitted to domestic inflation.
- Empirical Literature:
 - *Olamide et al. (2022)*: This study is relatively out of scope as it assesses the relation between ER, inflation, and economic growth rather than the relation between ER and inflation.
 - *Mahendra and Parulian (2021)*: Furthermore, the simultaneous test (F test), the exchange rate, economic growth, and the minimum wage have a significant effect on unemployment variables. Something is missing in this sentence.
 - Goshit and lorembor (2020): This study is also relatively out of scope as it assesses the relation between MPR and unemployment rather than the relation between IR and inflation.
- Materials and Methods:
 - Better to rely on the relatively high-frequency version of the variables.
 - "The ARDL Cointegration Analysis: The ARDL bounds testing approach to cointegration results on the effect of pension funds' contribution to economic growth in Nigeria is presented in Table 3 below." There is a typo here.
- Conclusion:
 - Since the objective of the study is to assess the pass-through of the exchange rate and inflation to unemployment, in the conclusion, you should start with the analysis of these core variables and then discuss the effect of trade openness on unemployment as one of the control variables.
 - You need to discuss the impact of inflation on unemployment in the conclusion.
 - The impact of other control variables needs to be discussed in the conclusion as well.
