Potential competing interests: No potential competing interests to declare.

"I found the article to be well-researched and thoughtfully written, highlighting several noteworthy aspects

"Could you provide a description of the statistical formula employed in the determination of the sample size?"

"The study lacks mention of the specific value assigned to Relative Centrifugal Force (RCF). Please refer to the article for a more detailed explanation: [<https://aap.onlinelibrary.wiley.com/doi/abs/10.1002/jper.18-0553>]."

"The discussion section appears to be inadequately substantiated and predominantly takes the form of a narrative review, with limited engagement in a comprehensive analysis of the results. A revision of the discussion section is recommended to ensure a more rigorous examination of the study's findings.

This article holds promise, and with some revisions, it could make a valuable contribution to the field.
