A good job, well done to these erudite researchers. I noticed the research design is more prophylactic rather than curative, and since the findings conclude prevention, I believed it should rather reflect in the title. I suggest 'Anticonvulsant' should be replaced with 'prophylactic potential on PTZ-challenged rats.' To the best of my knowledge, the experimental animal sampling is a bit small for such important and delicate research due to unforeseen experimental circumstances and for a better statistical result. The methodology for the extraction of MP is not properly stated (adequate quantity not reported) and is not referenced. This article requires some corrections before publication.
