

# Review of: "The SARC-F is a useful screening tool for detecting primary sarcopenia but not disease-related sarcopenia in ageing polio survivors"

Michela Bogliolo

**Potential competing interests:** The author(s) declared that no potential competing interests exist.

Overall, the study is good and interesting.

It clearly explained the correlation that may occur between people who have had polio and the manifestation of Sarcopenia.

However, there are some parts that are unclear and lack some information, for example:

- there is a lack of some information to justify your conclusions, i.e., to support or not support your conclusions.
- regarding the correlation between nutritional status and the presence of Sarcopenia, you may want to report more information about the nutritional habits of the sample of people considered.

Overall, however, the study is very interesting.
