Potential competing interests: No potential competing interests to declare.

The article Determining kinetics parameters of bovine serum albumin-protected gold nanozymes toward different substrates describes the activity of gold nanozymes covered by albumin. Unfortunately, the paper has insufficient results as a scientific publication. I would reject this paper.

Here are some comments to improve the quality of the text.

- The introduction poorly described the work and its novelty.
- The chemicals are not described, this should be addressed including their CAS number.
- There is only one TEM image of the prepared material, at least a UV-Vis spectra should be included.
- Experiments should be done in triplicate.
- Grammar checking would improve the text.
