The article is titled 'Drought Risk in the Mahanadi River Basin: A Multidimensional Approach for Integrated Urban-Rural Drought Management Strategies'. This study provides an integrated and multidimensional assessment that clarifies the drivers and locations of drought risk. The methodological approach used in this study took into account a wide range of parameters, including expert opinion, agricultural, hydrological, socio-economic, and meteorological aspects.

The article is very interesting and worth publishing. My comments are as follows:

- In general, the article is well organized and contains references to many scientific publications, including the latest ones.
- The abstract should be slightly shortened and include the most important information, i.e., purpose, methods, and results.
- The results and discussion were well described.
