Dehydrated Human Amnion/Chorion Membrane

National Cancer Institute

Source

National Cancer Institute. *Dehydrated Human Amnion/Chorion Membrane*. NCI Thesaurus. Code C126645.

Tissue derived from portions of the placenta donated by the patient during a C-section, with potential regenerative activity. Upon placement of the tissue around or on the affected area, dehydrated human amnion/chorion membrane (dHCA), which contains regenerative cytokines, promotes wound angiogenesis and may help heal the wound, restore tissue function and reduce risk of inflammation.
