The present review, titled "***Melatonin, ATP, and Cataracts: The Two Faces of Crystallin Phase Separation***" has been written very well. Although melatonin is known to prevent cataracts in various ways, the association of ATP and melatonin in preventing ocular pathologies is a novel area of research. However, there remain a few points that can add to the betterment of the manuscript.

1. The authors can consider adding a paragraph to their review that explains how the synergy between ATP and melatonin is better in preventing cataracts than the conventional methods of preventing cataracts.
2. The authors should elaborate on the future perspectives of their review in the conclusion.
3. The DOI numbers of the references should be added for better readability.
